Unsettled Babies – Differentials and **Treatment Option – ref262**

Steven Bruce

A very good evening to you. Here we are in the studio for another 90 minutes of CPD this time about the treatment of unsettled infants. Now we've put a lot of work into finding speakers on the topic of paediatrics, but perhaps not surprisingly, a lot of practitioners who work in this area are a bit reluctant to stick their heads above the parapet, probably thanks to the rather dubious tactics of the so called good thinking society, and they're even more dubious founder Simon Singh. That means that many practitioners are frightened to tell anyone about what they do, and that means parents are getting a very biassed message about paediatric therapy. And worst of all, a lot of very distressed babies are probably missing out on treatment, which could be invaluable for them. Well, here at APM we don't care about Simon Singh and his society, we can say what the hell we like. And I'm really pleased that we found a highly experienced chiropractor to tell us about the art of the possible in this field together with I hope, his experience of navigating the HSA regulations. Here's Mike Marinus who qualified a good 15 years ago now in South Africa, then went on to training paediatrics at the ACC in Bournemouth. Now, of course, the ACC University College. Welcome, Mike. Oh, thank you very much for having me. trips off the bloody tongue that a ECC University College does. You went there for a master's? Yeah, yeah. So what did you cover in your masters? Yeah.

Mike Marinus

So it was a great programme simply because it gave you the option to be able to dive into what you liked, which was always why when I get people asking, you know, should I go and do a master's my my first thought is, rather get experience under your belt. Because when you walk into something like that, it opens it up and goes, you've now had a taste. And you've had some practical experience, what would you like to understand more of? So what I ended up doing was exactly what I wanted to do was going into a lot of what makes babies tick. What do babies want? How does the family dynamic work right in the beginning, and those first couple of months, maybe six months, maybe up to a year, and I dove into a lot of some things that were upsetting. Like, I did quite a bit of work into sudden infant death syndrome. I did a bit of work into microbiome, which was phenomenal because then that opened up gut microbiome access to me, did a bit of work into Vegas. And then a lot of the work that I did, which is what we're going to talk about tonight, is how do we actually do

differentially diagnose unsettled baby, because that really for me is is the crux of that I got a little story that I always kind of think about with this, and I want to put it into the perspective of the practitioner that sees adults, you know, sees, let's say, non verbally challenged patients, right? So you normally see your patients that can come in and give you a history, the way I see this is you get an adult patient that comes in, but they are so beyond being able to communicate with you that all they're doing is shouting and screaming, every time you come near them, they pull away, you try to get a sense of what exactly is going on, there's no sense of what's going on. And then you go back to your notes, and you diagnose them with screaming. That's how crazy it is of what we're doing at the moment. And what we're saying is a choleric child or an unsettled child, I like to put it in terms of our adult patients and go the majority of patients that come to us are unsettled. The differences, we have access to them, and we have access to them being able to tell us what it is so we can get three steps ahead. The trick with paediatrics is especially the nonverbal guys that you have to make your way through there.

Steven Bruce

And I know we'll come back to a lot of this and you said we're gonna look at differential diagnosis of unsettled babies. But you've mentioned the Sudden Infant infant death. And I bet we get questions on that as well. Because I mean, it's all fascinating stuff. But I think probably every every medical practitioner I've ever spoken to, and all the consultants and everyone else who I've interviewed in here, they will all say that you only get good results if you apply the right treatment to the patient. And if you can't differentially diagnose a baby, then you can't know what is the right treatment for that baby necessarily. Do you think that affects the lack of evidence for paediatric treatment? Absolutely.

Mike Marinus

Absolutely. Because you can't have evidence if you don't know what you're looking at. And as we'll see in some of the slides, one of the one of the systematic reviews that Stuart will put up in 2014 talks I think he talked about Well, we'll see that the number is now somewhere around the the last 35 systematic reviews in colic that he'd seen 20 of them had different definitions. So I

Steven Bruce

interviewed a an osteopath, a very eminent paediatric osteopath about babies. And that was the first time I realised, actually colic is not a thing, colic is different things, and you don't know which one of those you're treating if you're gonna get it,

Mike Marinus

my best thing is colic is they don't have they do it. Right. It's something that they're doing that the whole point of colic is that you have a well child, you have a child that if you did every taste under the sun bar 5% of it, because about 5% of them, we know do you have pathology with the other 95% You kind of going well, you know where, what what could be causing this wake of this be coming from what could be because it's notice that's coming positive for you on anything that you're doing. But at the end of the day. And this we'll talk about as well. It's more a child trying to balance. But if you don't understand what those little blocks are that they're trying to balance, you got no, you've got no hope in being able to treat them. What will happen is you'll throw everything you have at them, and maybe something will stick. And that's not the way we want to practice. We want to practice by knowing what it is we're working on having done

Steven Bruce

a Masters, you will, I'm sure will be well versed in what evidence exists for paediatric treatment. Is there any? Yeah, there's incredible evidence. I

Mike Marinus

mean, yeah, I mean, there's there's one particularly that always gets overlooked, which was my mentor at ACC Joyce Miller, who in 2012, did a randomised control trial that was that had the parents were blinded from what was happening with the children. And they had a good sample size, and they came out with a very positive result. With chiropractic care with colicky babies, it at a lot of the time, it kind of gets looked at as an outlier. Then again, we have other work that Joyce has done, which I think was 2019 or 2020. We should did a big data study. And she went out and she said to all of the parents that were coming into the clinic and said. How do you feel number one about the kind of treatment you've gotten? And what are the outcomes that you're seeing? Because then we'll see in that in that startles. 2014 systematic review, one of the things they never look at is parental response. The thing is, it's the parent that notices the issue. It's the parent, it's the relationship that needs to be fixed by your treatment to get everything organised. So if you're not looking at how the parent feels about what's happened to their child, you're not looking in the right place. Because you can't say, well, let's say that old definition of colic, they say three hours a day to crying for three hours a day, I apply some sort of treatment, whatever their treatment might be, and I get that crime down to two hours and 55 minutes. I haven't won anything. I've changed anything. All I've done is my definition of my piece of paper. I've been able to tick the box. I've done nothing for the parent. So it's that kind of big data that can't really be done in an RCT kind of way. That ends up giving you a lot of good info Question but because it sits in another realm, it kind of gets washed.

Steven Bruce

You said there that you you'd had a at least a partially blinded study, that must be quite difficult to get through and ethics committees or at least get volunteers as parents presumably don't want to leave their babies alone in the care of someone else for treatment doing

Mike Marinus

difficult for chiropractic difficult for osteopathy difficult for medicine. The problem is the vulnerability of children. And it's a double edged sword because the vulnerable, you can't test anything on them. Because you can't test anything on them, they end up being vulnerable, because now we don't know what to do with them. And that works exactly the same way as medications. A heap of of hospital medications that are used on babies are used off licence because they can't test. So what they do is they go well, we'll give X amount, but we know very well that the glomerular filtration rates are not the same, we know very well that they, they, the physiology is set to be anabolic. So it's here to be able to draw as much as it can. And we know the half lives of drugs take a lot longer we know things like lead will be absorbed a lot more per raesha into a child. So you can't just say that however it does happen. And I think that's that's the crux of this question is to go, the evidence is lacking everywhere. And that's why people are going everywhere to try and find answers.

Steven Bruce

So I don't want to get down this rabbit hole too far at this stage. I suspect we met later on. There was a lot of criticism, and it was aimed largely at chiropractic at the time over claims for treating children, wasn't it? I think it was Simon Singh and his good thinking society. They looked at advertising and said, you can't say this, you can't say that. That being the case, is

it simply the fact that the practitioner is on the NHS and our advertising that kept them safe, because they've got to be doing something for babies that don't, don't settle? I

Mike Marinus

think perception is always big, you know, if you are perceived to be in a profession, that is evidence based, you can kind of do what you like. And you don't have to advertise, you can or you can say what you like, because you're really not going to get looked at and if you're in a profession where the perception is that you're coming from a place of no evidence, and you're coming from a place of not not having the patient's best interest at heart and not having all the data around you and not doing risk reward analysis when you treat patients. If you're thought of coming from that side, any claim that you make has a microscope onto it. And I think that's kind of for me, that's always been the difference.

Steven Bruce

You mentioned some slides earlier on. Just before we go on to the slides, just a reassurance as always that we will bring them up full screen for a little while. But I think the main purpose of this is for you to be able to look at our speaker this evening. And we will send out copies that were handouts from the slides later on. Probably tomorrow after the show. So should we move on to the Yes,

Mike Marinus

absolutely. There we go. Well, of course. Right. There we go. Okay, now we got that. Okay. So the first thing and this slide is always interesting to me, because not only are we looking at a colicky baby or an unsettled baby, are we not looking at the causes, but a lot of us call it different things. And a name is very, very important. So things like cry fuss is is good. It's one of the names that's being used in the literature. When we start to get more into the migraine literature. Now they use things like paroxysmal fussy infants, and I really liked that. That's Dr. Amy Gelfand is a paediatric neurologist. She's really, really good. And she's now starting to whittle it down and say fine, it's irritability, which is going to incorporate a whole lot of things so they don't have to cry and go crazy. They can just be grunting and irritating and it happens at different times or what have you. Then, of course, we have our classic colic from 1954 with Wesseling is rooming in studying what have you

Steven Bruce

then, which is the three hours? Yes.

Mike Marinus

So that's where that comes from. So it comes from the study in 1954. And it wasn't even about that. It was a rooming in study, to check a whole lot of other things. And what ended up happening is Maurice Wessel started seeing that there was this three hour gap and even when he's been been asked about well, in back in the day when he was asked about that, he said, Well, look, that was the average that we saw. It's not a magic number two is just an average of if children were crying for three hours and over then we saw them to be problematic, and if they weren't in that, however, that's changed a lot over time. So that was from November 1954 was an amazing time. When no one had gone to space yet. I think doctors were still recommending Marlboro. It was a whole other time and you could have a baby cry for three weeks. At a time it would be acceptable. This is the other thing. The definition has changed because we change and this what we're going to talk about in terms of Westernisation as well. Our whole society has changed and we end up blaming the babies yet the babies have a biological need for something and our lifestyle has moved away from so you end up with colic as a as a fight between biology and culture, which

we'll talk about. Then these last few these were really interesting. I sat in a talk with a psychologist and an OT. And we've all been brought up onto this panel to talk about me about colleague, the psychologist about attachment in the OT about sensory issues. And about half an hour in we got guys, we were talking about the same thing. We are all talking about the same thing. It's not just in the literature that it's different. Different professions have different names, because of course, we see things through a different lens. So that's also really important too.

Steven Bruce

So it was good to ask him that. So if you can get back to that slide that because you've got the three more of those irritable infant sensory infants, attachment issues, would a parent distinguish between those? Would they just say I've got a colicky baby?

Mike Marinus

So it that is that is such an important question, because at the end of the day, the parent and the baby have a colicky situation. And this is one of the things I tried to move towards when we teach when we talk about these things is that the child is having a difficulty within their environment. So their internal environment, the external environment, the parent, though, is also having difficulty with their ability to respond to their child, they're also having difficulty in in their ability to soothe something between the two has gone a little bit awry, which is why I like things like attachment issue and talking about it in terms of that, because a lot of the time will go up, the baby has the problem. And it's one of those things that because as adults, we have the power. And as babies that don't have the power, we kind of go well, this is the environment you live in now. And if you can't function properly in this environment, you get the diagnosis, you get the treatment. But at the end of the day, the way we work with him is a lot broader than that. And it's to start to teach parents to read cues and clues from babies and start to teach them to do things that the baby is biologically expecting. So things like skin to skin time, more caring time, when they transport them to be able to transport them holding and not transport them in buggies and that kind of thing. Because all of those have consequences. And one of those consequences is that your child ends up unsettled. But unsettled infant is the wrong word. It's unsettled, dyad or unsettled family because that's what you end up treating.

Steven Bruce

Just elaborate, if you wouldn't mind on what you mean by attachment issues.

Mike Marinus

So Bowlby was in the in the 60s was a wonderful psychologist that talked about attachment and attachment is all about those first 1000 days. And it's all about how does the infant's nervous system correlate and work together with the parent nervous system. And today, we can kind of take Bobby's ideas and put them together with Porges, his idea of polyvagal because they really work so nicely together, of how those two link up and that linking happens within those first 1000 days. But the trick is, it generally happens once quickly and forever. So the way that you are attached initially ends up giving you your outcomes as a family. One of the really interesting things is your your bad signs or your fallout from having a colicky baby tend to be relationship based things. So they tend to be how well does the child do in school late, it's one of the things that they'll check. But that very much has to do with how much input and investment is the parents or the family having the child to be able to help them with that. And a lot of those outcomes you can really Whittle back to going how much investment has been put in from both sides.

Steven Bruce

So I'm sorry, ask the questions. I just anticipated that somebody might say, Well, are we talking about feeding issues here and latching on, which is which sounds like attachment issues, but we're not we're talking about interpersonal

Mike Marinus

and those are in there as well. But that's a really bad that's a really great point because that is the focal point of having a poor just attachment generally feeling is is a hotspot for that because feeling has so much emotion around it. And there's so much guilt that lies around. And it's one of those things that if you feel that this is not going well and you have a child that's fussy and the other boxes are not being met, feeding becomes one of the main things breastfeeding is one of the main things that's dropped with a colicky baby.

Steven Bruce

Extraordinary as it normally won't have. It wasn't that long ago that people are actually recommending that women didn't breastfeed their babies. Yeah, there was a strong yep, there

Mike Marinus

was a wonderful I still remember I can't remember where the girl was from but it was unlike a national news in America, where she was trying to explain that breastfeeding should stop being seen as natural because this is causing a problem. And what we forget and this is where we're going to talk about Westernisation as well. With things like SIDS research and with feeding research, we forget that we have more than one bed in the household. We forget that it's an option to move a child to another bedroom. We forget that we have formula about that we have formula and other people just have no access to this. So it's a very sort of blinded and is a wonderful I wish I could remember the guy. Maybe we forget there's another day. We just take it for granted we take for granted but what we forget is Is that 90% of the world doesn't have another bit. And I don't, my

Steven Bruce

daughter would argue that she knows damn well, there's another bed for the baby. But it won't sleep there, it has to start

Mike Marinus

with her. So she knows in her this is the point she knows that the evolutionary epoch in which her baby developed in which that human baby with all of that neural integration popped out. And what it's expecting is the Savannah, it's not expecting a three bedroom two bathroom in Northland. And the problem is the moment that it separates from Mum, the having no smell of mum is not a Where did you go, it's half of me is missing. And these are the things we don't understand about them. Because we've kind of gone well, we know that that's there, why don't they understand so exactly to your point, that's exactly the kind of thing that we have to break down and not in a judgmental way, it's a way of going, if I open this door for you, you can see how many things you can actually do to be able to help. So it

Steven Bruce

sounds then that a lot of treating the unsettled infant, that being the topic of our conversation is actually treating the mother, or at least educating the mother if not treating,

Mike Marinus

and educating everyone that's around their child. So if it's the Father, if the grandmother that lives in the house, if you have someone in there, that's kind of against what's going on, it becomes very challenging as well. So one of the things we teach about a lot is that this is a family relationship based problem. And that's how you have to that's how you have to work. And because also, you have to give people tools, this is one of the worst. I literally had this this week, where mom came in and she said, I've been told by a health care provider that my baby is fine. One of the most detrimental things you can say because the only thing that's been said there is that you the baby is fine. Mom knows there's a problem. So the mom goes, Well who else could the problem sit with, and the only one left, it must be my problem. And then you degrade her confidence. And the best way to spiral down into having a more unsettled infant and unsettled family is to have a parent with low efficacy. So that's one of the big things is to open the door, be able to say, look, I want to give you these tools, I don't want to reprimand you for what you're doing, or why am I going to give you all of the you know, layer on all of the Western world's words onto your shoulders, I just want to show you what you could do to make these things easier that are maybe not the things that you've been told about. And it has a very chiropractic essence to it osteopathic essence to it, because at the end of the day we're looking at now we're not just looking at the whole patient, we're looking at the extended patient.

Steven Bruce

While we've been talking salami, Olivia sent in a question here saying, in your opinion, do some babies get unsettled and angry at the end of the day? Well, obviously some do. I think she's probably saying is that a more likely time of the day for? Absolutely,

Mike Marinus

absolutely. And very, very good reason for that. Because, and here's here's the other thing, which is a little bit of a mind bender, is that the is that human babies are born three months premature, because we ended up standing upright. So we've got a smaller pelvis, we've ended up having this in civilizations, we have this really big head. And so nature kind of organised this way of going well, if you want to be able to have a small pelvis and a big head, we're going to have to birth these babies nine months, three months early. So one of the things that it does is it changes, changes some hormonal things. And what you find is that you don't have melatonin for the first three months and melatonin runs that sleep cycle. So you don't have that calming effect coming in. But what you do have a serotonin and serotonin gets kicked out and that baby system at 5pm round about serotonin, the wonderful does a lot of good things. But what it does is it aggravates the smooth muscle of the tummy because it's still really soft, and it needs that hormone or extra tension to be able to push through without having a melatonin and having that that's why we get this 5pm witching hour, there's that there's also a migraine idea that only girlfriend came up with with, which is where you get all of this input through the day. And then you get to the point where you peek and now you have to release it. And as we know, babies don't have their nails to go get done. They can't go play golf. So at the end of the day, they sit with you and they and they and they offload.

Steven Bruce

Yeah. That's fascinating to know and I don't treat babies. But now and then I will have seen a mother who during the course of a normal treatment we say when babies have pain in the neck because it's doing so is there any chance that during the course because I know we're going to do some practical you're going to show people who are not trained, experienced in treating babies things that they might be able to do to help hold it or a longer course.

Mike Marinus

So what I'm going to do is show one or two things that you can take in your practice right now that are going to help so one of the things we know is that these children are irritable. And if you can remove anything just to get a bit of that irritability out, it works like a charm. So we're going to talk about helping them get some gas out and we're going to talk about helping them get some books out. That straightaway just makes the world of difference.

Steven Bruce

I should have told people in the introduction actually the lecture around the world on this topic don't use some bloke from a clinic in Southampton. He's made the trip up here for an interview. You aren't you aren't good at this

Mike Marinus

stuff. Yeah. So yeah, it's became a passion of mine, I think. And you know, the more families I work with, the more it becomes a pressure. Yeah. And that was part of coming to coming to the UK was to be able to be around to be able to go and teach getting getting involved in that now, which is also part of being here, which is good fun. But at the end of the day, yes, this is this. This is where my master's was focused. This is where my teaching is focused.

Steven Bruce

Someone called HG has, how many troubled babies do you think have mothers who have emotional difficulties? And I guess the implication there is, is it the emotional difficulties that are prompting the unsettled nature? So?

Mike Marinus

Absolutely. Well, we know, if you have a caregiver that is stressed, that means you have a sympathetically dominant nervous system, trying to listen to cues, and they miss those cues. And the more they miss those cues, the more the child has to shout louder and louder and louder. So a lovely way HD a lovely way of explaining this is, if you were to go into a restaurant, let's say you're a baby, because first of all, we think that being unsettled and crying is the first thing that babies do, it's the last thing that they do, okay? You go into a restaurant and you sit down at the restaurant, and you the lovely data is there and you're waiting, and you put your hand up to try and get someone's attention and they walk right by you. Fair enough, the next time they come you could you know, and they will, eventually you're gonna get up, you can stand in the middle of the kitchen, you're gonna shout or lose your mind. Babies are very much the same thing. So babies have a body language conversation they'd love to have with you, but they have to be on you. And if they're not on you, they miss that. Then they have their pre cry, which is the little girl and gauze and those all have little meanings that you can pick up if you know what you're looking for. It's only when that doesn't work that that graded. Severity starts to kick in and they start shouting and screaming. So if you have a caregiver who's not sensitive to those cues, and we know that postnatal depression dampens your sensitivity, dampens Edlin, Begin button input. That's not great. So that's why working with like postnatal depression is so so important. But absolutely right. And what we know as well is that if you look at children that are taken to an emergency or to an a&e with reflex, there is a there's it's a five fold more likelihood that that mother will have some sort of psychological something going on. If she arrives with a child at the a&e with Reflex so

Steven Bruce

postnatal depression does it in there lots of people living in very stressful households or environments, maybe several other kids or whatever, I'll

Mike Marinus

absolutely say this is the other you bring up such a such a valid point it because it's not like that three hours. Okay, let's take two very separate things. Let's say we have Angelina Jolie who has a million kids and she loves having children. And it's a wonderful pastime, she has a million people that look after him, she does from all over the place. And I'm guessing she collects carers staff to be able to look after them. And add, let's just say for example, she has all these carers, she has all his resources, wonderful. She loves working with her, and her child cries for eight hours a day, let's take a ludicrous thing like that. But then we have Lucy on the other side who has three children and as many jobs and she's a single mother and she's stressed and she has no funds. Three hours of crying is not the same, because you're inputting the same variable into very different situations, you're gonna get very different outcomes, which is why, what is excessive crying, or what is an irritable baby. It's whatever the parent says it is. And you have to then work from there. And you have to have your bias away. And you have to actually,

Steven Bruce

we've, we're half an hour even ridden one out of 12 slides. But it's possible we might not run out of things to say this pieces has it ever been shown that newborn babies have a higher sense of smell than the adult? That is to say, many adults can't recognise their partner by smell alone. Do babies really smell their mummies missing and cry?

Mike Marinus

Oh, we are playing with a team tonight. Okay, absolutely. Right. So we go through a pruning, right, and a couple of good couple of months, you've made your basic connections and whatever is not made that prunes out. babies start with for smell centres in the brain, we pruned down to one smell centre. And we can see that very well in what they call the breast crawl, which is where a baby is born and put onto mom's onto mom's belly. And because amniotic fluid smells the same as colostrum from the breast milk, they will start to make their way towards the breast just via smell, they will find their way towards the breast. So their sense of smell is immaculate in the beginning because again,

Steven Bruce

they do that to my grandson ages before he could crawl up. So it's this sort

Mike Marinus

of lumpy sort of bumpy, like looking around and trying to find their way but it's and there's actually there's nine stages to a breast crawl as well. It's a fascinating thing to look up. So at the end of the day, it's absolutely right smell is the way that they connect. And it is and that's one of the things that and this is actually a take home thing that folks can do right now to give them The parents a little bit of respite at home, is they smell you. So what you can ask her mom, if she's got a really clingy baby. It's like babies only happy when they're right on and then put them down and they start again, what they're doing a lot of the time is they're missing the smell. So what you can do, especially if you're breastfeeding, you take the shirt you're doing, you rub it, I mean, this get scrubbed, you make it smell as much of you as you can pop it down onto the sleep surface, take a hot bag, put it on there and perfuse that smell through the sleep surface. As the baby pops in, you take that out and you basically made a smell cardboard cutout for baby. So what they'll do is they do this thing called Conscious unconscious is they'll sleep and then they'll come to you slightly and they'll go because babies only really allowed to be enlightened, then no melatonin, so they'll sleep almost come to and they'll go, Can I smell mother? If I can smell mother, then I go back to sleep, which is

why they sleep so well, when they're with you. But when they're not they wake up they go hang on. She's not there. And that's not she's missing. That's a danger sign. So then they're up and they want it. So absolutely. I mean, it's a really, really good question.

Steven Bruce

I'm gonna take that one away from my daughter, because, yeah, my grandson has a bit of a new.

Mike Marinus

Here's another one he's in bed with. Here's another one you can pop in as well, which is really good. Which works well with that is people always want to put babies down head first, and then bam, second because they want to protect the neck on the way down. The issue being that you have a gyro in your head. And that's why Thorpe Park is so nice because it spins you upside down on all the rides and it makes you awake and it gets your adrenaline kicking. If your head goes underneath your bum, that gyro kicks in. So this is another thing if you're going to put them down and they're and you want to get that smell going pop them down, bam, first head after all of that together. And also the heating it means that you don't lose the heat from the mom's body onto the onto the baby bits of those three together such a winner. Right.

Steven Bruce

Simon says is there a natural alternative to serotonin that can be administered? You suggested you don't want to do that. You want some melatonin?

Mike Marinus

Yes. Yes. So interestingly, melatonin is a subset of total that came from the same place but and I think what we're what we're trying to say there was can you give, can you give a version of melatonin? So we know that they're giving it to migraine sufferers, and they're starting to get good results with us. And we know that together with that. We know that sleep is linked up in that and we know that sleep and meagre and have a lot to do with each other and migraine could be very much behind colleagues. We know

Steven Bruce

all of that. So give me melatonin so. So migraine sufferer and it's helping, and it's helping

Mike Marinus

immigrants and it's helping the sleep. The issue is that there's very good reason that they don't have melatonin is that you can't have babies in a hormonal sleep pattern. Babies for the first three months are eating machines that are not allowed to go to sleep like that they can only go through light sleep and then wake up and feed. You can't run the risk of having a baby that's that age, going into a chemically induced melatonin induced sleep missing

Steven Bruce

a field. This is the three months and you're saying they should still have been in here.

Mike Marinus

Exactly. Exactly. And they should still be getting consistent food all the time. So yes, there is an idea behind that. But the thing is, it's a non starter because they can't they're not allowed to have melatonin yet.

Steven Bruce

Okay, hopefully that's satisfy some HD again says does skin to skin stop working is a specific age, Surely not. So what is the skin to skin mechanism? It's not hormonal, it's not neurological, surely touch to touch between adults who is also using the same mechanism, which is what

Mike Marinus

it is. So the same hormone that relaxes babies is the same hormone that makes babies so at the end of the day, it is relatively hormonal the skin to skin and we get you you do create a hormonal storm with having with having skin on skin. Now, one of the first parts about this is that you have to be very careful in practice when you ask did you have skin to skin because a lot of parents will say yes. And then when you investigate further, it turns out the baby was wrapped up in a blanket when they were put on them. This is not skin to skin that's two people near each other with a blanket between so skin to skin. It's all about getting blanking on the hormones now. But oxytocin is the big one I was gonna suggest that oxytocin is the big one and oxytocin is the quiet one that you want when you are having your baby. It's the hormone that comes out when you are in the throes of making your baby and it's also what ends up especially in mothers in the connection with the babies in the first part. So having oxytocin and having skin to skin just allows that storm to kick in and it never goes away skin to skin is always a calming thing for for both participants. It's always a neurologically interesting question

Steven Bruce

on that very subject from Robin here. He is interesting to me. He says For that reason, would you recommend that mothers shouldn't wear perfume or scent? Because that is that going to confuse the baby.

Mike Marinus

It It's such a good question because I normally it normally skips a generation. And the question normally gets told to the grandmothers, I'm not sure why the grandmothers always get hit with this. But the grandmothers are always told, stop wearing all that perfume. Because the baby goes and there is a bit to that there is a bit, babies are looking for your natural scent. Again, I've got to be very careful because I don't want to take the moms everything away from her because this was a lot of the time what it feels like is that you can't eat this. You can't have that you can't smell nice. You can't look nice. You can't this is the truth in what they're saying. Absolutely, absolutely. Because they can make via smell. So it's actually something that I thank you for that. Thank you. That's something that I'm gonna go and investigate, actually, because it theoretically makes a lot of sense. Yeah. Okay. I'll leave it there.

Steven Bruce

Robin always comes up with your question. Thanks, Robert. He again says bath water comes baby's down rapidly question mark. Yeah, it doesn't the human bodies mainly water, how different and how similar these two types of water contact.

Mike Marinus

But HD remember, keep in mind that for nine months, babies are sea creatures that only become land mammals very, very recently. So the moment you put them back in water, which has a compression on them, the moment they've gone back to that amniotic fluid, again, that is really, really calming. The thing that's very just calming uncoming Find the right word now, is it removing them from the bath because again, that takes everything away, and

it's a big temperature change again, babies like what they know. And so getting them into the bath works like a dream. And it has but it's more theoretically I'm speaking from the theory. I mean, it could it could have to do with diaper contact and what have you, but at the end of the day, it's warm water, and it's them being submerged in water, which works really well. Okay.

Steven Bruce

We're gonna move on

Mike Marinus

to Hg and Robin if they've got already gone to sleep. Welcome. Okay. So we've talked a lot through this and I just want to make the point that fussy babies unsettled babies. It's not one group. This is like hip dysplasia. It's a spectrum of different things. It's like take your pics and cerebral palsy. It's a spectrum of things. You can get grizzles and grants right on the one side all the way up to unsuitable screaming, it's multifactorial, and the whole thing is there's a lot of interplay. So there's genetic interplay. You can have a baby because we know now that colicky babies have a much higher chance of having immigrant parent Megan's mother, and if you were a colicky baby, you have a much bigger chance of having me ground yourself so that we know that there's a genetic predisposition. Because when I say McGraw, and I'm talking about hypersensitivity, not particularly head pain, because children will have it more dominantly. In babies we think, express it this way. Then, of course, temperament also has to do with our Westernisation. We think they're playing up, but they're not getting the things that they're biologically need neurodevelopmental maturity, maternal prenatal stress, which is a huge thing, because maternal prenatal stress changes a lot of the nutrition down through the placenta into the child. So it can end up in a mechanical, chemical constraint to the child as well. And then birth complications, parents psychological disadvantage, it's crying, feeding and sleeping, these are the three things that interact with each other. Because if a baby is understood to have three jobs, it's getting someone's attention, it's getting food inside them, and then it's relaxing to do it all over again tomorrow. And it's those three things that interplay with each other. A lot. Okay, so if you look to the side of the screen that way, is where your colleague babies go, if you look to that side of the screen, that's where the unicorns are on the unicorns are basically just at this wonderful of lecture lecture, a friend of mine had came up with this, her book is all about the unicorn babies and these imperfect babies. But these are all just to explain to you that there are different kinds of unsettled babies. So our first one the baby's uncomfortable, Mom knows life could be easier. She's she's not going to get any diagnosis of that baby because they grant a little or they just, they don't respond to that to the care that she's that she's putting in. She starts to be worried about the relationship with dizziness, screaming so there's no red flag. So she gets she falls through the cracks. We don't try and help her because we try and explain to her she doesn't have a problem, instead of saying what we could do to help it. Then we have the grunting baby. Yeah, communication

Steven Bruce

issue there because you didn't say until the baby's fine. Yeah, yes. What is going on normal? And so she absolutely is fine. And the babies Yeah. I'm expecting you different.

Mike Marinus

Yeah, yeah. Thank you. Absolutely, absolutely. Right. Absolutely. Right. The second one is what we're going to talk about when we go we go to the bench just now the grunting baby. The granting baby are babies that have dyskinesia. This is this is a big part What I do is work with dusky sick babies. We all think it's constipation, but these are the kids that push down

for 10 to 15 minutes, they get purple in the face, they scream and they push, and they end up with normal foods or they end up with no poos at all. And at the end of the day, they end up getting constipation medication, which is the wrong thing. It can make reflex worse. And it's something that you can do a lot about. And we'll talk about that now. Then you have the child that fusses but they don't go into a full crisis. So they don't have that. They don't have the, what's the word, I'm looking for the that red flag that's gonna make people sort of jump and start helping you and do whatever, then we have the child that cries, but can be settled with loads of work. And I love that one, because this is the one where the parent will go, because we know one of the definitions is to say it's unsuitable. So if they're rocking the baby this way, and they're running this way and got the music playing. And then the baby comes down the line. It is equitable, but it's not manageable. So that's the other things. So all of these exist. And it's to understand that you can interact at different levels with all of these different folks.

Steven Bruce

And then off the spectrum over there, the ones that we can't see that they've got

Mike Marinus

So and that's will, that's where it becomes. So that's where you now have to start digging in. So now we start to dig into more like, is it a pathology? Is it electors and tolerance is it is it may be a reflex that involving so they're not involving? So is it a microbiome problem? So this side, we have to start getting our oh, what's the word I'm looking for? Well, my words are leaving me now. This is where we have to start getting our diagnostic skill better and better. Right. So let's move

Steven Bruce

the slide on to the next one, please. Just

Mike Marinus

my clicker is gone. Just

Steven Bruce

give me with the slider. Thank you. Lovely.

Mike Marinus

Okay, so this is the one we were talking about. This is the systematic review that shows the 20 separate definitions used in the last 39 colic trial. So this is the problem when you start making claims and saying, Well, I can sort out a colicky Baby, what are you talking about? Okay. And then when you say I can sort them out of those papers, 11 of them had different definitions of improvement. So what are you sorting out? What's the thing that you're fixing, and the 28 different interventions and 19 different outcomes. So it really is, this is the problem. We've got this adult patient that's coming in and screaming at you. And you've diagnosed them with screaming, and you can't work out well, we can't fix them. And the minority these trials use parental perception, we talked about this, it's so important to look at how the parent feels about what's happening. Okay, many effects involve the relationship we talked about that we talked about the fact that cessation of breastfeeding is a big thing harm scholastic achievement. And then of course, this definition changes over time. And the definition we're sitting with now is the 2016 definition, which goes more up to five months. So we've left the three months behind. And the reason that has gone up to five months is now we know that if that kind of unsettled training happens after five months. Now it's an issue of development, because we understand that under five months, the underdeveloped and this

is a way they'll respond. But over five months, they shouldn't respond that way. And the new definition talks a lot more about the fact that it has to do with the whole situation and not just the baby themselves. So the definition has moved on.

Steven Bruce

First of all, a call for many mothers with a baby who they perceive to be colicky or unsettled, or however they choose to define it is likely to be their GP over thought or perhaps the midwife or the the postnatal nurse, I forget the correct title that will they all be aware of these changes, do you think in definitions and protocols behind them and

Mike Marinus

see this is the thing, it's, it's quite a nice area to work in. And if you don't spend a lot of time in it, if you don't go and look for it. It's not just there, there's going to be no newsletter out with with this kind of thing. The other problem being their first port of call is going to be Facebook and their peers. And that's where things go really down the tubes I've seen. My wife works on a lot of these different groups. And some of the things that get said on the first of all the, the when they say in my honest opinion, you know, the biggest blame game is about to come up. And people are really rough with each other on to those groups, and they get quite bad advice, because the problem is everyone has an n of one or maybe they have an n of three, you know, at very best. And at the end of the day, they're giving out advice like well, this is exactly what you should do. And the thing is some of that advice hurts. So if you say you have to go on reflux medication. Here's a wonderful story, paediatrician mate of mine in South Africa. We were sitting having a chapter one day and he said, You know, I know that a proton pump inhibitor is bad for children. I know it has effects on the bones. Yeah, exactly. It wrecks the microbiome. It No these things, here's my problem. When the mother comes in, she won't leave my office until she gets a proton pump inhibitor because a friend has told me that that is exactly what she needs, and I have nothing else to give her. I don't know what else to give it. I'll send it to you. But I don't know what else to give you. So I'm in this position of guy. What do you want me to do? And he's, I mean, he was quite forthright to that saying some of them are it's it's hard not.

Steven Bruce

So we actually we have a role even if a patient is not coming to us. parent is not bringing their Pete their baby to us as a patient. We do have a role as primary health care practitioners in educating people to understand that Facebook is possibly not as well educated as a paediatrician Absolutely. Or paediatric osteopath, chiropractor.

Mike Marinus

Yeah. And we've all got our own roles to play. So the role that I see chiropractic and osteopathy fulfilling, is much wider than the trial that goes, they came in, and I did this manual manoeuvre on them, and then I sent them away. There's so much more around there, because that's not being filled. And what I find is a lot of parents will be happy to come because that this is gonna sound wrong, but the threat of medication is never the. So it's not that they'll come in, and now I'm going to be put on an antibiotic. Oh, I've been put on a reflex man. And the problem is if they get put on it, and they don't take it now there's all sorts of blame and everything. Well, you didn't do what we say to so almost coming just to talk without the threat of that happening, to be able to go what are my options, and I find that we always get put in a very interesting position because I have to come up with 50 other non pharmacological pain suppressant manoeuvres that we can use. So I have to be looking for all of that.

Steven Bruce

Your your lady who had the conversation with their paediatrician, she must have been told by somebody on Facebook or friend, whoever it was that the proton pump inhibitor had worked for them, maybe because? Or is it simply the question that the person who advised her wouldn't have realised the damage it was doing because it takes too long to manifest itself.

Mike Marinus

So I think there's so much to unpack with that. The one is we know from the research, it does nothing with unsettled babies. It's brilliant at stopping acid production. But when you try and put that against the unsettled nature of the child, we know that there's it never correlated never works out. There's there's the bias of hindsight, where you have someone that's now messaging on a group going, that was what worked, many things could have happened at that time. And now we can't quite remember I mean, we've all got those patients that come in, I we get it regularly, when the baby comes in, and the mom says, you know, my friend, Jess said you sorted this out and two treatments. Or Thanks, Jess, because that's not going to happen. That's not what happened. If I look back at my book, I suggest at least eight times and I followed up with it two months. But the way Jess felt it was it was cricket easier. We were done with it, which is fantastic. Because that was the perception I wanted to give Jace. But at the end of the day, the recall is a little biassed. So those those things will happen.

Steven Bruce

More questions have come in Emily says any amazing tips for postnatal depression Mother's not necessarily to do with the baby, but for them mothers themselves.

Mike Marinus

You know, it's such an intricate thing. Okay, here's the first thing is, again, this is not particularly a tip for a mum, but it's a tip for a family is to get other people in the family to watch out for the signs. Because the mom is going to not be great at being able to see that because mothers have a lovely brain architecture change, and they'll do anything and everyone else comes first. So they won't be the first one seeing these signs. So what we do a lot of the time is to teach dads to look out for things like language. So one of the things we often talk about with dads is to watch out for when mom starts to speak about the best things in bad terms. So to say our today, which was a wonderful day, today wasn't too terrible. Yeah, those kinds of little things. But it's to be able to pick those signs up. And the biggest tip I could give you is to get them to someone to be able to work that out with someone

Steven Bruce

to be careful not to cross a boundary here into an area where we're not experts. Absolutely, there are good resources I believe out there far

Mike Marinus

all we want to be as triage as experts. I just want to be able to be an expert of going hang on that not right and and also to be able to go I have a path for you to follow, and then be able to work in that and have a specialist there. But I think like we said already it's it's also a spectrum we go right from anxiety all the way down to the postnatal depression and you really have to be careful about it. But to pick it up and to get it sorted means that within that first 1000 days you get everything kitted out and sorted

Steven Bruce

out. Annabelle says if being in water is coming due to the pressure on the skin being similar to in utero. What about swaddling? Is it good or bad? Oh, swaddling

Mike Marinus

is such an interesting one. Okay, so let's first talk about swaddling in terms of that is healthy and unhealthy swaddling. We know that hip dysplasia is It's been changed to be called developmental hip dysplasia because it's no longer congenital because we know it can be made worse as time moves on percent of people in the background working nicely. So so what we know is that if you are going to swaddle, if your choice is to swaddle you, you have to swaddle from the top, but you have to stop at the hips, you can't have baby's legs extended and their legs internally rotated, because that's going to aggravate, and that's going to cause trouble. So the Australians are wonderful with this, they've got something called a healthy hip swaddle and you can buy it, it's wonderful. It's a swaddle that has lace at the bottom, so you can do nothing around it, which is great. The problem is that we are worried that it kicks in the parasympathetic nervous system. But the wrong part, we're worried it kicks in the dorsal vagus, and that is, instead of rest and digest, that's freeze. So what ends up happening is the baby's going to this freeze when they get swaddled really, really tightly and ways of checking that there are two ways that are really, really good are three ways in fact, the one is to put your hand on the baby's heart and they shouldn't be racing like crazy. The other one is to check if they get those little crow's feet on the side of the underside of the eyes. And the last one is to pop your hand in to see if the palms of their hands are sweating. Weirdly, sweating Palms is very, very good stress. It's a it's got a lot of reliability behind it to be able to tell that a baby is quite stressed out. So we're not sure about about swaddling at the moment. It see, it works with the majority of children and I use swaddling in one or two manoeuvres that I'll do so if I'm doing like Harvey Karp, this wonderful paediatrician has this five S's, which calms the baby down very quickly. I'll use it with that, but I won't keep them in the butt. It's a it's a hot topic.

Steven Bruce

I'm curious. What's the normal resting heart rate for a relatively newly born baby?

Mike Marinus

It's high. It's higher. It's not with me.

Steven Bruce

But it's somewhere up near 100.

Mike Marinus

I'm sitting between 95 and 100.

Steven Bruce

Yeah, so if we're looking for a racing heart, we're looking for considerably faster.

Mike Marinus

It's like a butterfly. Yeah.

Steven Bruce

Simon says what is the research between colic and migraine, which you earlier on?

Mike Marinus

Okay, Simon, go and look up a wonderful lady called Amy Gelfand. She's the one that's been doing a lot of this work. I think she she probably has about six or seven papers out now. All over PubMed go and have a look for them. Their ID

Steven Bruce

six, she's great. And I'll try to remember to look those up and send them the reference. Yeah, in an email after the flushing. Simon also says he gathers the latest research shows that the baby's stomach is in fact neutral pH.

Mike Marinus

Yes, so it's, it's, it's it's a very, very interesting setup. And one of the most interesting things about that is that milk works against acid. So the milk suppresses the acid in the milk keeps bringing it to that neutral. Now, this is a very true comment in terms of having a little bit of food all the time, where we again, in our western Westernisation, where we push to have babies feed every three hours, if you move over two hours, now you don't have breast milk to be able to work against that acidic pH. And now you start to get a resting pH level that goes up. So that's all based on having a baby feeding relatively so having a feeding on demand. Right? Okay, so if you taste those babies, they generally have a neutral pH.

Steven Bruce

Okay. I wasn't quite clear that what you said is a roughly normal average feeding cycle for a baby. So what is totally different? Yeah,

Mike Marinus

so what we do now is we say, somewhere between three and four hours, that's generally the advice. The problem is that advice comes with formula feeding, doesn't come off breastfeeding, breast milk and formula are very different from each other. And breast milk is designed to be able to be taken in very, very quickly. Okay, so here's an interesting story. In terms of it's our breast milk, that gives us a way as a carrying species. So our breast milk has high carbohydrate, low protein, low fat. If you look at a tiger, they have low carbohydrate, high protein, high fat, their babies get put in a nest, they go off and they hunt, and then they come back hours later, and they feed them again, the protein and the fat are there to be able to let them simmer, regulate to be able to lift them and to be able to give them really chunky food to digest over time. Without high carbohydrates, carbs go through you very, very quickly. We don't have the protein and the fat to be able to thermoregulate so what we ended up with is having babies on us and if we look at every other primate that works the way we do, they have constant feeding all the time. So what we should really be doing is having a baby on your hip, your baby on you having and stuff slip and stuff. That's the mammal way of feeding. What we've done is broken it into times because we learnt longer sleeping times and feeding times. All of those are westernised things that we do and their biology He will fight against that. Now, the thing is not misconstrue this and say that that is how you have to do it, some children will be fine with it. But it's understanding what is biologically appropriate, and what we're doing. So it's understanding that rye bread and ever and McDonald's burger are both food. But it's understanding that they're not the same. And that's the kind of idea between those feeding cycles.

Steven Bruce

So new keto diets for babies,

Mike Marinus

no, in fact, in South Africa, we have Banting, or the Banting diet, which, which is where you want to drop a lot of weight. And there's a low carb, high protein, high fat and so this is basically anti Banting. So this is the

Steven Bruce

effect the baby if the parent is on a keto diet, in an effort to lose weight, perhaps.

Mike Marinus

So it is interesting in terms of that you have to have breast milk doesn't just pop out of nowhere breast milk has to come from the constituents that you need. So it depends if you are normally a Keto Dieter, you will probably be okay. Because you're carrying on doing what you're doing. And your baby has developed within that environment. And now you're okay. The problem is to have a baby and now go now I'm only eating nuts. That's not the best idea. So it depends on your physiology.

Steven Bruce

I remember that advice being given, I think, to my wife when she was pregnant, it was now is not the time to take up triathlon. But if you're already doing it, you can carry on into that becomes uncomfortable.

Mike Marinus

because it's the internal environment mustn't change

Steven Bruce

basically says, Any tips on how to approach chatting to the mother, that the first thing might be a dyad event without making her feel villainized or inadequate? Or the cause of the

Mike Marinus

Absolutely. All you do is give her things to do. All you do is give tips. You don't talk about what's going wrong, because that doesn't help. All you do is it's all about positivity. It's what can you add? What can you add to do a wonderful Australian mate of mine, Paul talks about having the helpful basket and the unhelpful basket. And I love that. Because then you can say, look, these things that we're doing are great, but they kind of belong in the unhelpful basket. Let's fill the helpful basket with these things. And let's try and just take that energy that she's putting into it and just push it in the right direction. There never has to be a time where you say, well, that's wrong. All you have to say is, that's great. If we did it this way, this will be the outcome. So let out. So it's just about deflecting and moving on to the right path. Because at the end of the day, it's not about me winning and her being wrong. And her seeing how amazing I am. It's all about she has to be the hero. And I'm just the guide on the tour. So it's all about it's really Luke Skywalker of no one tells you this wrong. They just go pointed over there.

Steven Bruce

Right. Tracy says that she teaches and uses your baby birthing method with every infant that she sees every efforts to get to avoid going down for painful wind later in the day. And it really works. Oh, cool. Yeah, we're gonna talk about that just now. You want to do more of this first, which we'll go over them to know. Let's go. Let's go poker baby.

Mike Marinus

Yes, indeed. Indeed. Well, we'll be talking about that. So let's start up here. So let's start up here. Okay, so this. So this is Travis Travis, the travelling doll who my daughter named him.

So Travis comes all over the world with me and teachers all over the place. Okay, so what are we going to do now is we're going to talk a little bit about burping. Now, this is stuff that you can give to your parents straight away. And it really, really helps. Okay, so the idea is that the idea of how we would normally burp a baby is like this, we'd sit them on our lap, have them right up over like this, and we sit and cat on it. The problem is that a two in the morning, this becomes this. So we want to take the petting away. Also, if you sit and pass on them, what ends up happening is you break down those bubbles, to be able to burp a bubble out, we want to have a big air bubble. So you don't want to fracture those bubbles. Because if you do, they'll go down. And then we're going to have three hours of trying to push in here to be able to get everything out. So we don't want this also, these a lot of the time, our reflex the baby's reflexes and colic babies go into this pista tonic position and they like to go into this extension, that's going to cause inflammation at the back. So if you want to keep your baby asleep, that's not what you need to do. So we've surfaced, that's not what we're going to do. So what we're going to do is get them into this this little grip with this thumb on the side and our two fingers over there. I've got baby right up against me here, my hand here my hand here and I'm going to get them as straight as I can. Because what we're trying to do is I want to get a straight pipe between the stomach and the air because burping is passive. So if I can get the high pressure in the stomach to connect the low pressure outside, the burpple pop up and that's what I'm after. So it's much more about this position then this

Steven Bruce

is even quite forceful. They were poor little Travis.

Mike Marinus

Travis has been through it. So but but absolutely right because everything we're doing is no more false than you would put on your eyeball. So So you want to get them right on it. Hand over here over here. This is wonderful for people with big hands. If you have smaller hands, you put them this way, hand goes behind. And you can have them like that, just as long as we're nice and straight. Now the trick to this is to get a little bit of a bounce. So my leg would be down here, and it's a little bit of a bounce underneath. So what I'm trying to do is get the air bubbles to move around so that I have a better chance of them popping up. So we've got him straight with a little bounce underneath. So that's kind of the first position. Second position that works really, really nicely is to have traverse here, underneath, and I'm going to lift underneath there, and then I'm going to bounce again, because I'll be seated on a lower chair. The idea here is I'm lifting the diaphragm away from the top of the stomach, and I'm making a little bit of space for those air bubbles to be able to pop out. The last one is for the dads that works really, really nicely where we pop over the shoulder here, and we come underneath onto the leg. And it's a little bit of a wobble down like that, those three to move around works really, really nicely. Okay. And

Steven Bruce

lots of people, of course, will put the baby here, but not that many people thought about doing that.

Mike Marinus

So there are two problems. So the one is if they go here, all of this crunches up underneath the moment you get them to hook over here, they get to extend and release. Now the problem is, if they're up here, that way, everything gets tight. So I really want the whole idea of this is to get the pelvic floor moving slightly so that I can get the stomach to be able to move, I want to have them nice and straight and a little bit of a wobble underneath to be able

to move out. If I can get those three together, that tends to get air out a lot nicer than sitting in petting.

Steven Bruce

I suspect a lot of parents, and I'd be one of them thinks it's actually quite nice when baby draws his knees up.

Mike Marinus

Absolutely, yeah, the problem is it makes it very difficult because now you've got pressure sitting on to the stomach, and you've got pressure pushing it in. And what we want is the stomach to be as open as possible, simply because air generally ends up in the fundus of the stomach. And we need them to be able to stretch out to be able to pop down at that

Steven Bruce

good. Yeah, that's nice and simple. Yeah. It's really nice to get my daughter to practice

Mike Marinus

it. So that was nice. The other thing that we're going to talk about now is for those disco music babies now those are the babies that sit and push a lot of the time basic terms, what's happening with these babies is they've mixed up what to push with the crunch with their tummy muscles and their diaphragm and they pull their bum closed. So they'll lay down this way, and they'll pull their legs up like this. And they'll be really, really tightly packed. The problem with this is that and we know from some very strange research that I think is out of Sweden, that even 1/3 of adults can't pass this to lying down. So lying does read difficult position to do this. So what they're wanting

Steven Bruce

will be interesting research, I don't know many adults who would even try, they

Mike Marinus

used a fake stool, whatever that is, instead of the fake stool, and put these poor people in different positions. So they put them in squats. Standing up lying down in the tents down lying down is the hardest position to try this at home. Yeah, this comes with a disclaimer. Okay, so what we're gonna do here to be able to help with that, we're gonna go to this one over here. Now I want to teach baby to be able to push with your tummy. But open your bum because the mix up is the crunching the tummy and pulling the bum closed, the giveaways when they lie down and mums and dads will know because they start at the monitor starts to go. It's this buildup of this push. And so what we did to be able to help them this works nicely before you feed, we go thumbs up, thumbs behind the knees, bam, flat, knees out to the sides. And here's the trick, I'm going to roll into a squat, but I'm not putting any force onto the baby. What I'm doing is coming up only to the point that I feel Chevys his stomach muscles pushing against my fingernails, because I'm holding him in the position that he can't get into because I'm facilitating. So I'm just to that point. And I'm allowing him to push against me. So I allow him to push me for three seconds. And then I reset him all the way down to the bottom, come up again three seconds and all the way down. We do that three times. The second one instead of a bicycle like it were like that was we're going to do a little frying pan which looks like this, which is a little wiggle, which generally the heads are a little data, we don't get this whole mobile app here and the wobble is just down yet. But that works really really nicely for 10 seconds. And then we want to follow the colon around. So we come up five, across five, and down five swipes only as hard as you would put pressure on your eyeball. The idea of doing all of this is that if we can do it before they feed because when

they feed, they have a gastro colic reflex and they eat and they want to push everything out of the tummy. And that's when they kick this in. So if we can do this before they eat, it means that when they get a feeding the feeding will be a lot more relaxed. After feeding. The best thing you can do in this really is a little pot of gold doing this is holding here, fingers underneath the knees, get them into that nice open position. And then we use what we call the transport reflex. So we know That recon baby is done if we move with him. So we get to this open position just like we had down there. But now we go for a walk around the house, that position in that and then going into wounding works like a button because then we can get as much of the gas out. And all we're doing with all of this, I'm not saying the gas causes the problem, I'm saying I'm reducing friction. And the less friction within the baby, the more they're going to be able to do the crying the why they don't they cry, but they're feeding and they're sleeping. But

Steven Bruce

they're happy doing this, they're not skin to skin, they're facing away. So smelly. We're not worried about those things at the snap,

Mike Marinus

because we're close enough. And yeah, and also, skin to skin tends to work a little bit better belly to belly, as well. But also this one is where I want them to be as calm as possible. And if they start with their pushing just that position, it's really amazing. Just getting into that position just allows them just to drop, and it takes all that pressure away. And then what that allows for which actually is a great point is to get them skin to skin with you. And then what you can do from all of your burping and everything that this is wonderful to be able to put them down, holding them belly to belly with you like this, you can get yourself reclined into a chair. So there's an easier passage to allow all of them to move down. Then when you pop them down, you pop them down onto their bum first, then the head second. And we've got that heated situation we talked about. That is a setup for success to be able to get a baby

Steven Bruce

to relax. Good stuff to stay here. Can I get by with my questions behind it's got to be really nice. ambo says is there any strength in a suggestion that by continuing to do sporting activity through mid to late pregnancy, there could be some problems caused with birth, eg delayed or prolonged and unsettled babies.

Mike Marinus

There's there's nothing that I've read about unsettled babies. I don't know about the research out there about about birth issues around that. One thing I can tell you is I've got a friend of mine who is a CrossFit nut, and has the strongest ABS I've ever seen. And she was told to slow down because her baby actually had no space to grow. That's the only thing that I've come across. But really I haven't I've, again, it's like you were saying if you do triathlons, if you do things, go into your things, do the things that your body is used to do.

Steven Bruce

I think I forget what it was we had a discussion a few weeks ago when I think that same point came up that say if you're if you're supremely superbly fit, and it can affect the length of pregnancy,

Mike Marinus

take up rock climbing.

Steven Bruce

You mentioned at the beginning and I'm intrigued by say the business of stillbirths of sudden infant Did anything come out of the research that you were doing? Can you give us it? Can you enlighten us give us any hints or thoughts on how to minimise the risk?

Mike Marinus

Yeah. It's really, really interesting because it's all about messaging. At the end of the day, it's a very, very nuanced situation. And when you do public messaging to the levels that the countries have to do their public messaging to you kind of start understanding why they say well, I can't give out a nuanced message, I just have to give out the message of sleep on your back. Now we know that sleeping supine leads to all sorts of plagiocephaly issues. We know reflex babies hate to do it. Also find me another monkey that lies down sleeping on its back. But what that what that brings us to is a risk and reward because sleeping in a prone position or sleeping in another position. Yes, it has benefits to it. But it does come with a certain amount of risk. So it really depends who you were talking to because and I'll give you a wonderful example of sign sleeping. The only issue with science sleeping is that if the parent puts them down incorrectly, they may roll onto their tummy, the position of science steeping, according to the literature that I've read, and I bet I put my hands up there may be new stuff I don't think there is. But the actual being put in the position on the side, there is no problem with it's all about the fact that we can't message that to everyone on one big banner. Back sleep works when you messages like that. However, there are a myriad of different things. If you are formula fed, your risk goes up if you are not in your parents room, your risk goes up. If you are in on the same surface, your risk goes up if you do the wrong things. So here's the other thing is just starting to say to people, well, you can Coastie because we know that that's the way biologically it's biologically appropriate to do. However, there are other things in our environment we do that aren't biologically appropriate, like we smoke. We drink so I had a patient who about two years ago came in devastated that she had rolled a bit onto her baby while she was sleeping. And she said you know the thing is, I wasn't drunk. I'd had two sips of wine and that And this is the issue is you don't have to be full down drunk. When you're sleeping together and you are working off that connection of mother and baby, you cannot have your senses dampened because it will go away. So you can't be on medication to calm yourself, you can't. And there are so many things that you have to do, right? If a mom has long hair, she needs to tie it up, you can't have pets in the rooms, or the siblings can't be the bed can't be against the wall, there are so many things. And what's really interesting is a new paper that's just come out now. 2022, from an author called Moon who is really really does a lot of work around suits. For the first time they've started to actually publish what those things are that you should do in the beginning of the paper, they say, Look, we don't endorse this. However, if you were to find yourself in this position, these are the things that you might consider doing and then they start giving the list. So it's very nuanced. And it's not just it's fine to do it. You have to know what you're doing. Because it's, it could be a problematic situation if you did,

Steven Bruce

yeah, I suppose. Lucy is coming with Lucy says this is really helpful advice. Thank you. Thank you, whenever any of the not quite at the end of the show. I would like to raise the issue of the Advertising Standards Authority and the Committee on advertising practice the body that actually sets the rules for advertising. How do you get? How do you get the word out?

Mike Marinus

It's, it's very difficult, because I also coming from South Africa, where we were in a bit of a more more of a grey area where we could say, you basically you could say, a lot of what you liked. The HSA is tricky, because we have no whole day we have no, we it's not us who give them the standard that they want. It's them that are in the position to choose the standard of evidence that they deem is fit. So, you know, the one thing that I hold on to hope with is if if I look at PubMed stats, and I look at the amount of research that is going into paediatrics at the moment. And even if I look at I had a trip now where I went to Sydney to go speak at the kids summits and we raised I think we raised \$60,000, for chiropractic paediatric research. That's the idea is to start to get it to that level, because we can't change it. It's what they've said. We can be upset about it. You have to be careful about what you say, as we've seen with the with the systematic reviews, it's, but the thing is, if we have to be careful, everyone has to be careful, or should have to be careful about what they say. But

Steven Bruce

however activists only in this sense, it's only chiropractors and osteopaths who have to advertise because otherwise you'll go to the NHS and you'll be told to go and see when he's not advertising. It's only advertising that they care about. Yeah, I've got a I've got a list of I've got a set of words from the Advertising Standards Agency, on what chiropractors and osteopaths are allowed to say, which show Justin's brought up. And it's very interesting because we are allowed to refer to stick treating specific population groups. So we can say we can treat babies, we're just not allowed to say what we can treat babies. So we certainly can't say colleague, but we can say that we can treat babies and children which is useful to know. But both of the both of our groups osteopaths, and chiropractors, you know, we're both in exactly the same wording. But both of us have a list of conditions that we're allowed to say we treat. And the AASA says that, beyond that, we probably shouldn't, we'd have to have robust evidence to justify anything that's not on that list. He certainly is longer than what physiotherapist have, which is curious. It is.

Mike Marinus

But I see. It pushes me in an interesting direction, because I want to get away from that word, because I don't like it. Which colic? Yes, I want to get into the specific of what I'm helping with.

Steven Bruce

This is only an example. But I can't say you can treat. They're saying unless you've got evidence for that specific problem condition you can't see.

Mike Marinus

And that's where in the longer game, I would like it to move to in terms of having the research actually bear down and look at those specifics. We've starting to get into sub grouping. And then to actually subgroup and go right, what did we do for this? But then again, are we going to mix up the profession? And, and and the tool that we use? You know, am I gonna say it's an adjustment, or it's a chiropractic session that I've had, and those two are very difficult as well. You know, that's why the real world data is is fascinating, because then you have a parent that goes well, I had I had the full experience. And this is my this was my takeaway.

Steven Bruce

My advice to people with as with regards to the HSA and and their authority that the cap is that. As I said there was a list of things that we're allowed to say we can treat, and they say you've got to have evidence for anything else. provided you've got what you believe to be

robust evidence, I would say to anybody, stick it on your website, because the worst thing they can do is tell you to take it down. If you don't take it down, they can then accuse you of unprofessional behaviour. And that could be a complaint to the General Counsel. But if you let's say you've got a paper and they don't agree that the paper is strong enough to merit what you've said, then they'll tell you to take it down. They've specifically said you can't use the word colleague here. But again, this is this is me being perhaps a little bit more forceful than many people working our way around the situation or working our way around. Yeah, I do think that maybe there is a place here for a pragmatic trial where we don't say you're going to treat babies with this particular subdivision of colleagues, here's a baby with a problem, you will not see what happens. And then after a period of time, we see how many babies came out of there chiropractic osteopathic treatment or whatever the alternatives are. And we're better and use that that pragmatic trial rather than try to, rather than try to nail down what the condition was, because it's a bit like those trials where you see what we we practice manipulating the OA joints to see if that fits what we don't just put manipulate one joint general things. And I suspect that, you know, you do the things you've demonstrated here when you treat babies or advise their parents, but you probably do other stuff as well. You know, just the sorts of things to help with those babies.

Mike Marinus

Absolutely. That's, that's the whole point is to is to be able to give this sort of whole person care as much as you can. Yeah.

Steven Bruce

Someone called C says when co sleeping, why shouldn't a bed be against a wall?

Mike Marinus

Because of risk of the baby getting breached? Right? Okay, it's all about waiting. Yep.

Steven Bruce

And somebody says, for Stephen, for non regulated professions, you might be able to say what you like, but I have a feeling it's different for osteopaths and chiropractors, because the general counsel's might go for it. Just think you need to be careful when you advise people to do and that's signed CX. So that's come from my wife, who keeps me in track on track a lot of the time and in check. We have a lot in common. I still stand by what I say, you know, when you are advertising, it's the ASC and ESA and the cap, who dictate what we're allowed to say, and they dictate what grounds you must have to say something different. And if you're advertising is wrong, the first port of call for a complainant has to be to the HSA. And it's only if you disobey the HSA, they should then go to the general counsel's complaint. I'll probably I'm going to France tomorrow to see my wife and I suspect we will have a long conversation about this. She'll tell me what, I think you've done it now. Dominic says Does my fantastic guest speaker mic offer any courses?

Mike Marinus

Do you know you don't? Yes. Yeah, yeah. So so the two sides is I'm actually going to be I'm in France in November teaching and yet we'll be teaching it I've got some some online stuff that's coming out now on my online platforms. And that's and yeah.

Steven Bruce

One here that you may well be aware of is Felicity says There's recently been an osteopathic cuties trial for colic results and it'll be published soon Yes,

Mike Marinus

yes. I'm looking so so forward to that coming out. It's I've got I've I do a podcast with with an Australian friend of mine we we've been looking at this we're about to do an episode on it. It looks huge. It looks like it put a lot of time into this a lot of effort into it and it looks like it's gonna come out come out really nicely. I'm glad you look into that Felicity great.

Steven Bruce

I think it's absolutely wonderful but it gets to me is that calling it cuties? I don't know, people spent too long trying to find appropriate acronyms

Mike Marinus

working a little bit in academia. Now in teaching a little bit on this course at the moment. I just it this is academics, it's what they do. Yeah, they've got I mean, they've got it, they're doing it, that's the main thing. They've got the each trial for the for for solid foods, they're the, you know, they'll do anything.

Steven Bruce

A third of the trials spent trying to work out what the acronym is. Pip says, I always say that I have a look to see what stream patterns are present from birth, etc. That may be contributing to whatever condition they present with, I never say I can treat those conditions as they're often multifactorial anyway. And Biomechanics is just one component, which I'm sure you're going to agree with. But also, of course, we can say what we like to the patient or the parent or the patient. We just can't advertise a lot of things. So if a person comes in and you say you believe you can treat colic, that's okay, that's not advertising. That's you advising a patient? Yeah. Well, if it all goes horribly, well wrong, and something really nasty happens to the baby, the patient, then there might be a potential for a complaint somewhere else. I'm guessing that doesn't very often.

Mike Marinus

Yeah. And I think, you know, you got to manage expectation all over the place as well. And when you're working with with the patients, and the parents, I try and stay away from actually like that first one with the strain patterns because I generally stay away from saying, you know, we'll treat this thing I tell them what to look out for. I tell them what's normal, that shouldn't happen. And I tell them what we're going to do to move towards that now was the Australian keep everyone Yeah,

Steven Bruce

if I were advising someone who's very wanted to do without any great expertise in paediatrics, and I wouldn't suggest you say, Yeah, I can treat colic to the patient, I'd say well, a lot of people would call what's happening here colic, I'll look and see what I can find the strain patterns, whatever. And let's see what happens. I have success in doing this with other babies.

Mike Marinus

That's the thing. It's taking that evidence base that proper old Sackett evidence based approach of going a third of it, here's the empirical evidence, the evidence is, whatever the evidence is, here's my expertise. I've been doing this for 17 years, I'll tell you what, I generally see this as a child that is maybe going to take us a bit longer this, I'm very happy that we should be able to come right and then the last part guy, are you okay with this? As as, as the family you know, are you happy to put in your work because without that, you know, we might not come to the resolution?

Steven Bruce

Okay. The Qt is trial going back to that raises problems in my mind, because, you know, I'm fond of telling people that osteopathy doesn't fix people. Chiropractic doesn't fix people. It's what those practitioners do with their hands that fixes people. And it could be the same it could be different it could be what physiotherapist do or anybody else does. It could be completely standalone purely something that only chiropractors do. When that cuties trial comes out. Let's assume for the moment that it's positive, and it says that we have a statistically significant beneficial effect on babies with whatever the target condition is. Will they still will that still be able to be applied to chiropractic technique? are the techniques suitably similar?

Mike Marinus

Yes, yes. When it comes to paediatrics is there's a lot of a lot of the teachings that I've undergone. When I've been looked into osteopathic text, a lot of it sits there as well. So there's a lot of there's a lot of interplay between the two, when it comes to that, because, again, it's very soft technique. And there's not many ways you're going to do that. And there's not many ways that the tissue in the fascia is going to work together. So they're

Steven Bruce

actually thinking this to myself, if I were a chiropractor, and it's an osteopathic study, I want to read the study, they're doing what I do, and the study was significant.

Mike Marinus

That's always the thing is to break that that ICT down and go, is the patient that I have in the population here? Who would they would have been kicked out? You know, on problem number two, and then we'll get another witness. Yeah.

Steven Bruce

So I don't know the public. Do you know, the publication date for that study?

Mike Marinus

No, it's still a little bit because I got really excited about it. And then I found Chris, who I met, I said, Have you heard about this, and he was like, slow down. It's only coming up in a little while. So I think it's a compliment.

Steven Bruce

I was astonished and appalled when I was talking to someone else on the show to find out how long it actually takes to get a study published in a peer reviewed paper journal,

Mike Marinus

and then even nominally, and all the talking happens, and then they stop. And you go, yeah, it's so by the time it comes out. And it says the date 2022 on it as a 2017 draft, it's taken forever to get

Steven Bruce

clear wants to know what that podcast you mentioned is called.

Mike Marinus

So so I'm a I'm a junkie of making podcasts that podcast with Christian is called to peed, Cairo's. So it's the number two and then

Steven Bruce

if you let me know what, I'm putting that onto my email, and similarly with courses, then we'll put all of that stuff out there. Because cancer has said, Where will you be teaching in France? Because she's an austere in France, and she's desperate for good CP? What do you mean, you're desperate for good CPD, this is good, CPD cat. Where are you teaching in from?

Mike Marinus

Or it's been set up by the wonderful French Chiropractic Association. So it is somewhere about an hour's worth of Paris's All

Steven Bruce

right? Emily says, treating babies with cranial cranial sacral therapy, how many sessions to tell the parents as usual, I know people want magic within one session. But realistically, what do you think?

Mike Marinus

So my problem with anything like that is if if I can fix it in one session, it means it can revert in one session. So I don't like that it's going to take us time. Generally, if we look at our upset babies for treatments is my my stock standard is twice a week for two weeks. That gives me a little bit of time to know what I'm working with, with the parents with the child, how are they responsive, because also, I may have a situation where I have a child who's very high responder, and I can't do a lot. I work on a sphenoid. And all of a sudden, they get really, really hyped. And we'd like to work with those. Those little blood pressure monitors and stuff as well. So you can tell how they're doing until what resilience they have. And at the end of the day, everyone's slightly different. I say I want four treatments with you just to see what's going to go on. And then I won't change within those first four, because if I don't have changed, then I got to look somewhere else. But in Google, sort of one of my one of my areas I'm looking for change. And with with cranial it's about the same. It's about the same but I mean, it's not unheard of to see eight or nine, but it's not about for me that's still fixing a problem. It's not about just keep coming in every week until it's enough that it's about getting the problem sorted and then we can move on. But that's what I would say somewhere between four and six

Steven Bruce

Yeah. Okay. But somebody has says here that this is Steven they say I can't remember who recommended Mike. But could I say our public thank you to them? Because it was one viewer and another paediatric Cairo. So yeah, I mean, I suspect that most people are very glad that we got you on the show that sort of thing. I should save till the end. But it's just popped up at the top of my my question list here. This piece is out of interest. We know when the force smell sensors dissolve into

Mike Marinus

one, it's when you get that big coal. So generally, somewhere between six and eight months is where you get that big neurological call, that starts to happen. And then a lot of that's when all your, all your potential moves away. So basically, whatever you've wired, says the nerves that fire together wire together. And then we get to the point that there needs to be

that big cut off, or there needs to be that pruning because you can't run all of those. So we go from being generalists as babies to then becoming quite specific.

Steven Bruce

Okay. And what I've got here, I've got somebody who the system is calling guest 4872. There's a reason for a seven two rings a bell for some reason here wasn't John Val, John's number was zero. What do you say to parents with regards the age of weaning, I had a mum say today that she was looking to wean around three, three and a half months after her health visitor, it was okay for a hungry baby. It is just that Current research indicates six months, but how do you explain all that to patients? Okay,

Mike Marinus

so there's a new piece of research that I think is doing the rounds, and they're talking about three months at the moment. So here's the problem with that, you need to have three things working, when you're going to win number one, the child has to be able to have a flat hand grasp of the food, bring it toward the mouth, so that must be able to they must have the fine motor to be able to grab it and find the midline. Second thing is they need to be able to be sitting up or seated for the duration of the feed. You can't feed a child that's hanging off the side. I'm not saying sitting but sitting in a highchair or sitting wherever. And then the third thing, the parent holding them Oh, exactly, yeah. So they must be able to sit in some sort of chair. And then the third one is that that sack reflex has to have gotten because it's unsafe to put solids in a child's mouth when they go and they have to suck away. So that suck reflex has to go so all three of those the theory suck reflexes gone. That means that they can't breastfeed, surely, I don't know. So the suck reflex. So it's a primitive reflex. So the idea being that it's only there until the brain can connect with the muscles involved, and it can run it from a higher centre. Okay, so that's just more an automatic that happens. So what I want is to be able to put the food in and they can play with it with their tongue, but they don't have to automatically swallow it back down, when does that normally disappear. So that will go in about three months. Sucking rooting go really, really quickly. But the really important in the beginning to be there. If those three are gone, the assumption is that the kidneys are ready. And the assumption is that the gut has tightened up enough that now we can start throwing bigger proteins in the end of the thing is between that four and six months is a golden opportunity to get the reactive proteins in. So the things like eggs and fish and all of those things that they could have problems with. So we don't want to get those in after because that becomes a little bit of an issue. But I know that there is a trial at the moment that is being spun all over the place where they're trying to give solids to three months old, and it's just not biologically appropriate.

Steven Bruce

Right. Okay. Interesting that because some mothers will breastfeed their babies for a very, very long time. And presumably that can go on in addition to Yeah, solid semi solid food.

Mike Marinus

Well, we're suppose that World Health Organisation suggest that you should exclusively breastfeed until six months. Is that still their advice? Yep, that's still their advice. And then you should carry that on for a minimum of two years. The problem is, every country in the world falls hopelessly short of that. But that's the advice.

Steven Bruce

Okay? Excuse me. Tracy says, How do you use probiotics.

Mike Marinus

So probiotics, Tracy, now you've stepped on a landmine because probiotics are really, really interesting. And we, with our little ones, we want to look at things like bifida, bacteria, lactobacillus, because those are the commensals, those are the ones that are really going to work well to be able to, first of all teach the immune system, which is really important second of all, be able to get the best out of all of the nutrition that's coming in. And also they take the place that could be taken by the Proteobacteria, the really bad bacteria. So those are the ones we want in. So those are the probiotics we want. However, the theory has been for a long time that we give probiotics, and that populates the gut. But what the research is saying now is that God is populated and it's already got people live in all those houses. You don't just send new people in and old people move out the houses, the houses are full of people. What they're assuming now is when we use probiotics with bifida and lacto, is that they are creating an anti inflammatory effect. So they're having an extra anti inflammatory effect which is calming, which settles the stomach which does all those things. So the way we so that's really interesting because what we used to say was use five drops of probiotic once a day. But now that was under the pub Fill out the gut theory. But now the theory being that we want to have an anti inflammatory effect, should it not be one drop. Now, one drop later, maybe three drops at five o'clock when we know it's gonna get bad. So the theory is starting to change. But probiotics is that that's where if you want to follow the money, that's where the money is, at the moment in terms of research is probiotics, and prebiotics. We've

Steven Bruce

got no objection to probiotics. No, no, they're absolutely great. You've got 30 seconds on this one. Oh, crikey. There's more questions coming. Yeah, cool. Sean Bell, John's number is 2468. What not? Yes, and it was more about probiotics. So my question, again, you got 30 seconds on this, I heard from someone who would be regarded as a reasonable expert recently, that modern formula is pretty much as good as breast milk.

Mike Marinus

So one of the things that breast milk does that formula can't do is it changes through the day, its makeup changes. So in the evenings, you will get the higher building blocks of melatonin, into the breast milk connection. What breast milk also has is prebiotics, they have these human oligosaccharides, which feed the good bugs. So there's an I know there's a whole lot of ideas of putting those into formulas at the moment. There is nothing really that beats breast milk, the other things can close. I think the thing is, it's always an alternative. It's never, it's never going to be the genuine article. It's great that we have it. Because for a lot of people, they really require that. However, I would put my head on a block and say no, it's not the genuine.

Steven Bruce

And I guess for most people, the only reason to do it is because baby can't feed properly or won't feed properly. And maybe there are reasons that we could look at

Mike Marinus

where we can address it. It's it's a nightmare. It's a nightmare. Feeding really, isn't it?

Steven Bruce

Well, we have still had a few more questions coming in when we were speaking. But we are out of time now. I'm afraid that's been thank you for coming in from Southampton for. Let's hope that you can get a few of the viewers from tonight on some of these courses or the capsuleer. It would be great to watch the recording. It would be great to have that. And yeah,

thanks for having me. No, it's been it's been my pleasure really has. That's all for this evening. I sincerely hope that you found this useful, even if you don't treat babies yourself, because it is it's great to be able to inform parents of what's available to them, whether conventional medicine or otherwise.
