Evaluation, Reflection and Impact on Practice:

This discussion examined how external factors can influence treatment outcomes in patients. The addition of mass, conductive material, or the earthing of the practitioner was demonstrated to increase the range of motion achieved in 4 separate patients. A possible mechanism for this effect was proposed.

Separately, 2 patients who had suffered emotional trauma were treated using a combination of added mass and conductive material, while the head was manipulated (not using HVT - the approach had more in common with cranial therapy). Both patients reported an improvement in the way they responded to memories of their trauma.

On reflection, while I feel I would need further training to utilise this approach myself, it is further emphasis on the connection between emotional and physical components in a patient's condition, and it opens the possibility that physical therapy can help with psychological trauma.

Personal Notes

(For added information, for example if your "Reflection" differs from our suggestion)

Chiropractic Code 2016

A Put the health interests of patients first
