MUSCLE TONE INHIBITION

with Simon King

Recording:
*Learning
by Oneself*

Evaluation, Reflection and Impact on Practice:

This discussion considered the hypothesis that muscle tone (and therefore strength and efficiency) could be inhibited neurologically as a result of various types of foreign body. These included dental devices(fillings, crowns, retainers, implants), body piercings and jewellery. A rationale for the hypothesis was provided, and video evidence to support the concept that treatment outcomes could be enhanced by removing or altering the foreign bodies was given.
